DETAILED ACTION

1. Applicant's request for reconsideration of the finality of the rejection of the last Office action is persuasive and, therefore, the finality of that action is withdrawn.

Double Patenting

2. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1 – 40, 69, 70 and 71 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1 - 19 of U.S. Patent No. 6,694, 822. Although the conflicting claims are not identical, they are not patentably distinct from each other because both sets of claims include a sensing device including a plurality of layers

Art Unit: 2855

comprising at least one non-magnetic conducting layer, at least one ferromagnetic layer, one layer having non-zero magnetostriction and sensing a resistance in the plurality of layers upon application of pressure but does not disclose a support structure and a substrate for mounting the sensor.

However, Ganapathi et al do not disclose a substrate and a support structure. However, a beam serves as a substrate for the sensor structure (See Cols. 9 and 10, lines 66 – 67 and 1 – 3).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate a support structure and/or a substrate for the purpose of, providing a flexible sensor arrangement to detect stress or deflection in the structure under applied pressure (See Ganapathi et al, Col. 7, lines 25 – 41).
